Ledgerline Expense Tracker

A responsive personal finance app for tracking money with clarity

I built Ledgerline to make everyday money management easier to follow. It brings income, expenses, budgets, cash flow, and monthly reports into one clean workspace, with account-based Firebase sync designed to keep a user's records available across devices.

PRODUCT	BUILT WITH	DEPLOYMENT
Personal finance web app	**JavaScript · Vite · Firebase**	**Vercel-ready web experience**

What the app does

- **Tracks income and expenses.** Record amount, category, description, date, payment method, and optional notes. Edit or remove entries and use search and filters to find records.
- **Supports custom categories.** Add personal categories for both income and expenses, then use them in transactions and budget planning.
- **Summarizes the month.** The overview brings together balance, income, spending, savings, recent activity, and cash-flow trends.
- **Makes charts interactive.** Cash-flow points show daily income and spending details on touch, hover, or keyboard focus. The chart display can be set to a bar or pie view.
- **Helps plan budgets.** Set monthly spending limits overall or by category and compare spending with those targets.
- **Exports useful reports.** Download CSV data or an Excel workbook with a monthly summary, transactions, category breakdown, and daily summary.

Designed for everyday use

Ledgerline includes light and dark themes, adjustable text size, a compact transaction list, a preferred payment method, and profile controls. The layout adapts to mobile screens with touch-friendly navigation and smoothly animated interactions.

PRODUCT AND IMPLEMENTATION

How Ledgerline is built

The application is a browser-based single-page experience built with JavaScript and Vite. Firebase Authentication handles account access, while Cloud Firestore stores each signed-in user's transactions, budgets, profile details, custom categories, and preferences.

Core implementation

- **Authentication.** Email and password registration and sign-in, Google sign-in, password reset, persistent sessions, and sign-out.
- **Private cloud records.** Firestore organizes records under the signed-in user ID. Security rules are included to restrict each account to its own data.
- **Live updates.** Firestore listeners keep account data in sync while the app is open. When a new account has records saved only in the current browser, the app asks before importing them.
- **Account preferences.** Theme, text size, default payment method, compact list preference, chart style, profile name, and profile photo are saved with the user settings.
- **Responsive interface.** The same web app supports desktop and mobile browsers, with responsive navigation, transaction forms, charts, and settings.

Technology

Frontend	HTML, CSS, JavaScript, Vite
Authentication	Firebase Authentication
Database	Cloud Firestore with per-user records and real-time listeners
Hosting	Vercel static deployment
Exports	CSV generation and Excel workbook export

Deployment note

The site is deployed on Vercel. For authentication and cloud sync to work on the hosted site, the Firebase web app settings must be added to Vercel as VITE_FIREBASE_* environment variables, and the Vercel hostname must be authorized in Firebase Authentication. The app shows a setup message until those hosting settings are present.

Project summary

Ledgerline combines practical transaction tracking with personalized budgets, interactive visual summaries, exportable reports, account-based cloud storage, and a mobile-friendly interface. The project demonstrates the end-to-end work involved in building a useful finance product, connecting authentication and a database, shaping a consistent user experience, and preparing a web app for deployment.

OPTIONAL LINKEDIN CAPTION

Introducing Ledgerline, a responsive personal finance app I built with JavaScript, Vite, Firebase Authentication, and Cloud Firestore. It supports income and expense tracking, custom categories, budgets, interactive charts, Excel and CSV reports, account settings, and mobile layouts. I also prepared the app for Vercel deployment with Firebase configuration. #WebDevelopment #Firebase #JavaScript #PersonalFinance
